

## NOVA HIGH FLOW FAN UPGRADE

SeedMaster would like to inform you of a new High Flow Fan Upgrade that is now available for our Nova lineup. Preliminary testing has shown that the new High Flow Fan will provide a 20% increase in air flow over the current Standard Flow Fan. This represents a vast increase in air output, while consuming a similar quantity of hydraulic oil (14 GPM maximum). This High Flow Fan Upgrade is **not** available for SeedMaster on-frame granular tanks.

**2015 Tow-Behind Nova Tanks** will be factory built with two High Flow Fans. This is a standard feature.

**2015 Tow-Between Nova Tanks** will be factory built with two standard flow fans. Fan requirements are normally lower on tow-between models because they are typically paired with smaller drill widths. Customers who purchase drills wider than 70' are encouraged to upgrade.

A single High Flow Fan upgrade (SM Part # 501780) is available for **2012, 2013, and 2014 Nova Tanks**. Please allow for a 12 week delivery timeline. This upgrade includes a new hydraulic motor, external coupler drive, and fan cage assembly.

**Note:** Only one fan can be installed on 2012, 2013, and 2014 Tow-Behind Nova's. This includes 2014 summer builds. This one fan limit is due to the increased weight of the High Flow Fan. On these units, the High Flow Fan Upgrade would replace the fertilizer fan.

We thank you for maintaining your SeedMaster equipment. If you have any questions, please contact your SeedMaster Certified Dealer directly.
